

INTRODUCING COLORS

P PLASMA
D DEPOSITION
T TECHNOLOGY

Black, brown, beige, grey light fixtures... how boring! For the longest time you have been bound by these basic color finishes because among other attributes they blend well. Never mind if you wanted metallics that's just not going to happen.

What about if you desire just the opposite and require a statement from the luminaire or for certain architectural and specific design elements to be carried out to the fixtures?

Want seamless color integration and to achieve a flow with the look of a space?

What if you already have light fixtures specified but the manufacturer doesn't offer custom finishes?

We hear you and are introducing a multi step water based plating process that creates a reflective metal film that allows for any color finish you can imagine including shaded metallics of stunning purity and vibrancy. This is not regular paint nor a powder coating rather a newly developed and revolutionary bonding process that removes previous limitations and allows your talents to show. PDT® finishes are luxurious, durable and show quality craftsmanship.

So go ahead show us your creativity whether its bold, classic, extending a theme or showing detail we can help you with the industry's only water based coating that can be applied over any non porous surface.

LEDRAYS provides PDT® as an option to its custom line of luminaires and provides this coating process as an outsourcing service with quick turn around times.

Show me the COLORS!
